

Module Specification

Information Systems Development 1

Version: 2021-22, v2.0, 23 Jul 2021

Contents

Module Specification	1
Part 1: Information	2
Part 2: Description	2
Part 3: Teaching and learning methods	4
Part 4: Assessment.....	6
Part 5: Contributes towards	8

Part 1: Information

Module title: Information Systems Development 1

Module code: UFCF9F-30-1

Level: Level 4

For implementation from: 2021-22

UWE credit rating: 30

ECTS credit rating: 15

Faculty: Faculty of Environment & Technology

Department: FET Dept of Computer Sci & Creative Tech

Partner institutions: None

Delivery locations: Frenchay Campus

Field: Computer Science and Creative Technologies

Module type: Standard

Pre-requisites: None

Excluded combinations: None

Co-requisites: None

Continuing professional development: No

Professional, statutory or regulatory body requirements: None

Part 2: Description

Overview: Not applicable

Features: Not applicable

Educational aims: See Learning Outcomes

Outline syllabus: Introduction to information systems: The general features and functions of information systems from a business perspective; real time and

embedded systems

Legacy architectures software and documentation; the issues associated with replacing or keeping and maintaining legacy systems

User and system requirements, functional and non-functional requirements, organisation of system/software functional requirements in a requirements document.

The purposes, objectives and activities of information systems development: establishing requirements, systems specification, analysis, design, development, testing, configuration, implementation and maintenance.

The social and technical organisation of the development process. Technical roles and responsibilities and the role of the client.

Models of systems development; the systems development lifecycle and its various forms, phases, tools, techniques methods and deliverables.

Evaluation, critique and applicability of strategies for design and development.

Developing data, data flow, state and process models, and their use in creating requirements specifications for information systems development.

Overview of the issues in management of organisational data and introduction to relational databases and database design

Configuration management and the deployment of software releases; developing and applying user documentation and training materials as part of software development and deployment activities

Functional prototyping using open source platforms, tools and languages

Part 3: Teaching and learning methods

Teaching and learning methods: The course will be delivered through a combination of lectures, tutorials and lab-based practical sessions. Lectures will cover the theoretical content, which will be reinforced in parallel through thematic tasks in the tutorial or lab-based practical sessions.

Some topics will be covered in tutorials led by the lecturers and/or tutors; these sessions will impart thematic knowledge and skills through tutor-guided mode of delivery and benefit the students by providing immediate feedback.

Practical sessions are designed to supplement almost all lecture topics and provide the students with an opportunity to solidify their theoretical knowledge and gain practical skills related to each lecture's theme. Most of the practical sessions will involve database design, achieving data quality, database implementation, designing industry standard data flow/state/process models and creating requirement specifications for information systems development.

Scheduled learning includes lectures, tutorials, and practical classes.

Independent learning includes hours engaged with essential reading, directed practical work in a computer lab, assignment preparation and completion etc. These sessions constitute an average time per level as indicated in the table below.

This module will involve 6 hours contact time per fortnight. The time will be divided between lecture sessions, tutorials and practical lab sessions. The module contact time will be 72 hours, with 28 hours spent in lectures and 44 hours in tutorial or lab-based practical sessions.

Over the course of the academic year students should expect to spend approximately:

Activity (Hours)

Contact time (72)

Assimilation and development of knowledge (148)

Coursework preparation (80)

Total study time (300)

Module Learning outcomes:

MO1 Understand the benefits, general features and functions of information systems

MO2 Understand why a business case is needed and create an outline business case for a technology-enabled business solution, including an assessment of business benefits, impacts, risks and return on investment

MO3 Demonstrate an understanding of the Systems Development Life Cycle (SDLC) and the role of systems development approaches, methodologies, models, tools and techniques within the life cycle

MO4 Understand the fundamental components of, and the interactions between, technology solutions in a typical modern business environment.

MO5 Identify, select, justify and apply an appropriate set of tools, techniques and methods to support the analysis, development, delivery, release and configuration management of software products

MO6 Apply basic formal processes to construct, implement and exploit a well-designed relational database schema

MO7 Develop and test a small scale technology solution utilising an industry standard approach and a widely-used contemporary programming language

MO8 Specify and develop a user interface based on requirements

Hours to be allocated: 300

Contact hours:

Independent study/self-guided study = 228 hours

Face-to-face learning = 72 hours

Total = 300

Reading list: The reading list for this module can be accessed at [readinglists.uwe.ac.uk](https://uwe.rl.talis.com/modules/ufcf9f-30-1.html) via the following link <https://uwe.rl.talis.com/modules/ufcf9f-30-1.html>

Part 4: Assessment

Assessment strategy: The module is assessed by coursework that allows the student to demonstrate practical application of methodology, tools and techniques, drawing on theoretical aspects of the module. The learning outcomes addressed by this assessment are set out in the Learning Outcomes section of this document.

A central plank of information system development practice, working productively in teams, forms a major element in students' practical engagement with the groupwork component of assessment for this module.

The coursework will be carried out in small groups of students commensurate with the complexity and scope of the specified coursework. This has the benefit of creating peer groups, providing a support network for learning, allowing for the consolidation and sharing and dissemination of prior learning and the practice, improvement and assessment of key transferrable skills.

Coursework deliverables will be assessed by a combination of individual and group work. 70% of the coursework marks will be allocated to the group and 30% will be reserved for each student's individual report/portfolio. The coursework demonstration and individual assessment will be carried out in class. Staff will provide on-going guidance to students on working in a group and the work of groups will be continuously monitored in workshop sessions so that problems and disagreements over 'contribution' can be resolved in a fair and equitable manner at the earliest possible opportunity.

The coursework deliverables will be an appropriate combination of models, artefacts and systems and software components (including data structures and source and executable code). As such, provision of a word count is inappropriate, but students

will be given clear guidance as to the nature, scope and depth of the required deliverables.

Tutorial and workshop time will be allocated so as to allow formative feedback to be given as the coursework portfolio develops, to enable the tutors to spot and prevent plagiarism, to ensure the full and equitable participation of group members and to facilitate the marking of groupwork. Where the 'contribution' of particular group members can be clearly demonstrated to be greatly more or less deserving of the group mark awarded, an adjustment can be made (especially in the case of non-engagement); The adjustment being based largely on the ability of the student in question to demonstrate a full, detailed and critical understanding of the group deliverable during the presentation.

The referral coursework will be undertaken on an individual basis and will require the student to build upon the groupwork undertaken during the module through the production of a well-integrated and complementary set of deliverables. No presentation of this work will be required.

Assessment components:

Portfolio - Component A (First Sit)

Description: Coursework portfolio

Weighting: 100 %

Final assessment: Yes

Group work: Yes

Learning outcomes tested: MO1, MO2, MO3, MO4, MO5, MO6, MO7, MO8

Portfolio - Component A (Resit)

Description: Coursework portfolio

Weighting: 100 %

Final assessment: No

Group work: No

Learning outcomes tested:

Part 5: Contributes towards

This module contributes towards the following programmes of study:

Software Engineering for Business [Sep][FT][Frenchay][3yrs] BSc (Hons) 2021-22

Software Engineering for Business [Sep][SW][Frenchay][4yrs] BSc (Hons) 2021-22

Software Engineering for Business {Foundation} [Sep][FT][Frenchay][4yrs] BSc
(Hons) 2020-21

Software Engineering for Business {Foundation} [Sep][SW][Frenchay][5yrs] BSc
(Hons) 2020-21
