Part 2: Description

Educational Aims: Knowledge of a range of mathematical tools which are used to synthesise, analyse and evaluate different engineering situations is fundamental to engineering. The student is introduced to a range of basic mathematical tools which are required and developed in later modules.

Outline Syllabus: Algebra and Functions

Dimensions of physical quantities, revision of standard engineering functions such as polynomials, rational functions, partial fractions, exponential and logarithmic functions and trigonometric functions.

Complex Numbers: Roots of polynomial equations, basic algebraic operations, rectangular, polar and exponential forms, Argand diagram, principal branch, Euler's formula, De Moivre's theorem.

Matrix and Vector Algebra: Properties of matrices and determinants, the inverse matrix, Gaussian elimination, applications to systems of linear equations. Vector and scalar quantities, resolution of forces, properties of vector quantities, vector addition, unit vectors, position vectors, scalar product, vector product. Eigenvalues and eigenvectors.

Calculus

Differential Calculus: Concept of a limit, revision of standard derivatives, linear properties, product rule, quotient rule and chain rule. Higher order derivatives, classification of turning points, parametric differentiation. Sequences and Series, Binomial theorem, MacLaurin series and Taylor series expansions.

Integral Calculus: Revision of standard integrals, indefinite and definite integration, integration by parts, applications of the definite integral such as finding the average value of a function, root mean square calculations, centre of mass and moments of inertia.

Solution of Differential Equations: Modelling of simple systems, solution of first and second order linear constant co-efficient ordinary differential equations, natural and forced response; applications such as cooling problems, mechanical and electrical dynamical systems.

Laplace Transforms: definition, manipulation, standard transforms, inverse transform, solution of linear differential equations.

Computing Methods

Introduction to numerical methods: time-step approach to dynamics problems. Using (for example) Matlab as a tool for engineering analysis, command line, m-files, functions.

Programming structure, "if/then" commands, for loops.
Using software to solve differential equations.

Teaching and Learning Methods: Scheduled teaching hours will take the form of:

Whole group lectures, used to deliver new material and to consolidate previous material

Small-group tutorials, with activities designed to enhance the understanding of the material delivered in the lectures and to apply the skills and knowledge learned from the lectures. These will also include practical sessions to work on PC's where this is appropriate.

Scheduled classes: 84 hours

Assimilation and development of knowledge: 140 hours

Coursework preparation: 36 hours

STUDENT AND ACADEMIC SERVICES

Examination preparation: 40 hours

TOTAL: 300 HOURS

The module is delivered by means of lectures and tutorials or workshops. To prepare for assessment, students will be expected to undertake self-directed learning in addition to the directed learning which supports taught classes.

Part 3: Assessment

The examinations are summative and assess the students' understanding of concepts and techniques, and their ability to apply them in relatively straightforward problems.

The coursework is both summative and formative. The computer based tests assesses competency with the mathematical methods taught in the course. Feedback from the coursework is intended to assist students to prepare for the end-of-year examination. The assignment will assess understanding of numerical techniques and competency at writing and implementing software code and as a solution method.
