Part 2: Description
<p>Educational Aims: In this module students will be introduced to advanced mathematical techniques used in the solution of engineering problems. Applications taken from heat flow and structural mechanics will be used to illustrate the techniques.</p> <p>Outline Syllabus: Mathematical content:</p> <p>Complex algebra: Basic algebraic operations, complex solutions to quadratic equations.</p> <p>Linear algebra: Determination of eigenvalues and eigenvectors</p> <p>Fourier series: Properties of periodic functions, odd and even functions. Computation and convergence of Fourier series.</p> <p>Differential equations: 2nd order linear constant coefficient differential equations, resonance. 1st and 2nd order partial derivatives. Solution of separable partial differential equations.</p> <p>The module is delivered by means of lectures and workshops. To prepare for assessment, students will be expected to undertake self-directed learning in addition to the directed learning which supports taught classes.</p>

Part 3: Assessment			
<p>The examination is summative and assesses the students understanding of mathematical concepts and techniques, and their ability to apply those techniques to a variety of problems that test understanding of the engineering context. Students will have the opportunity to prepare for applied/modelling type scenarios which will then form the basis of a structured examination question.</p> <p>The computer based tests provide frequent and instant feedback to students about their progress through the module.</p>
